# VIRTUAL DOUBLE CATEGORIES

3

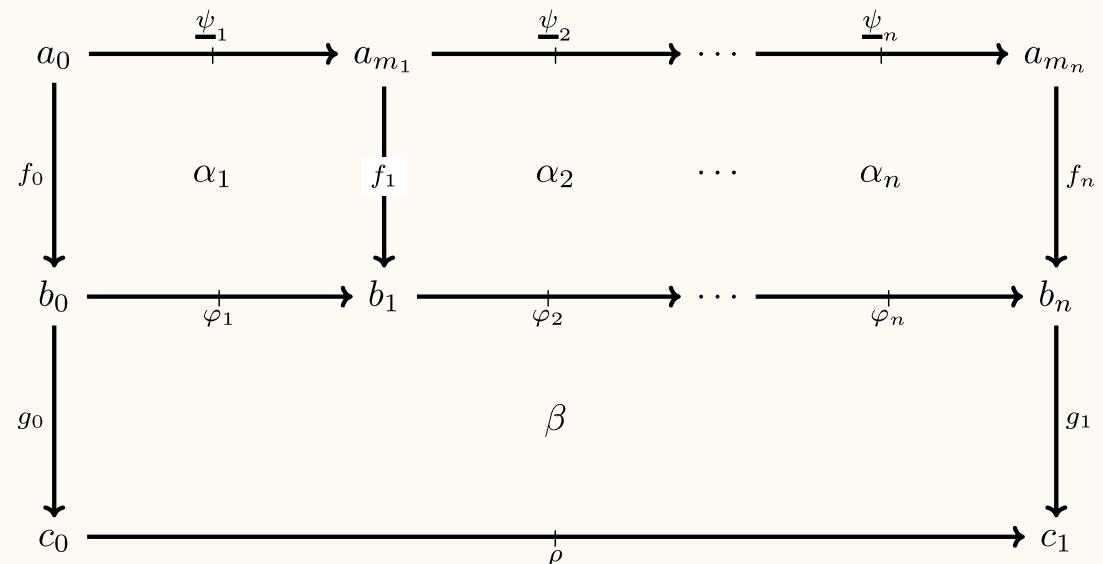

## Definition: VDCs

A virtual double category  $\mathbb{D}$  consists of

1. A category  $\text{Tight}(\mathbb{D})$  of objects and tight, or vertical arrows
2. For every pair of objects  $a, b$  a collection of loose arrows  $a \nrightarrow b$
3. For every boundary of loose and tight arrows a collection of cells

Along with an associative and unital composition of cells:

**Note:** Together with VD functors and tight transformations, VDC forms a (co)complete 2-category with finitely presentable underlying category

# PSEUDO VS. VIRTUAL CONSTRUCTIONS

4

## (Pseudo-)Double Categories:

- If  $\mathcal{E}$  is a category with pushouts, we have a double category  $\text{Cospan}(\mathcal{E})$
- If  $(\mathcal{V}, \otimes, I)$  is a monoidal category with finite coproducts that are preserved by  $\otimes$ , then we have a double category  $\mathcal{V}\mathbb{M}\text{at}$
- If  $\mathbb{D}$  is a double category with certain reflexive co-equalizers, we have a double category  $\text{Mod}(\mathbb{D})$  of monoids in  $\mathbb{D}$

## Virtual Double Categories:

- For any category  $\mathcal{E}$ , we have a virtual double category  $\text{Cospan}(\mathcal{E})$
- For any virtual double category  $\mathbb{D}$  we have a virtual double category  $\mathbb{D}\mathbb{M}\text{at}$
- For any virtual double category  $\mathbb{D}$ , we have a unital virtual double category  $\text{Mod}(\mathbb{D})$  of modules in  $\mathbb{D}$

# UNIVERSALITY OF VIRTUAL CONSTRUCTIONS

5

## Universality of Constructions on Virtual Double Categories:

- For any category  $\mathcal{E}$ , the virtual double category  $\text{Cospan}(\mathcal{E})$  is the free virtual equipment on  $\mathcal{E}$  [DPP10]
- For any virtual double category  $\mathbb{D}$  the virtual double category  $\mathbb{D}\text{Mat}$  is the free coproduct completion of  $\mathbb{D}$  [Kaw25]
- For any virtual double category  $\mathbb{D}$ ,  $\text{Mod}(\mathbb{D})$  is the cofree normal completion of  $\mathbb{D}$  [CS10]
- For any virtual double category  $\mathbb{D}$ ,  $\mathbb{D}\text{Prof} = \text{Mod}(\mathbb{D}\text{Mat})$  is the free collage cocompletion of  $\mathbb{D}$  [Kaw25]

# PRO-REPRESENTABLE VDCS

6

## Definition: Pro-representable VDCs

A virtual double category  $\mathbb{D}$  is said to be pro-representable, or exponentiable, if the functor given by sending a virtual double category  $\mathbb{A}$  to  $\mathbb{A} \times \mathbb{D}$  admits a right adjoint:

$$\begin{array}{ccc} & (-)^{\mathbb{D}} & \\ \text{VDC} & \begin{array}{c} \swarrow \\ \top \\ \searrow \end{array} & \text{VDC} \\ & - \times \mathbb{D} & \end{array}$$

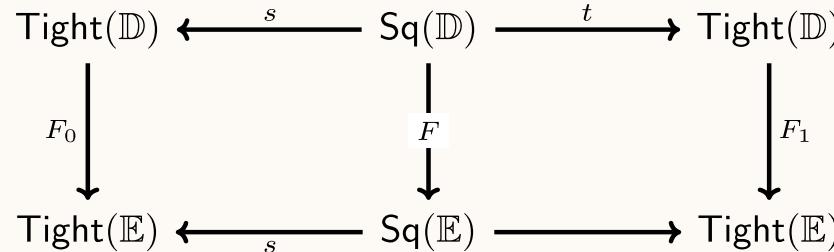

# EXPONENTIALS

7

## Explication: Exponential

If  $\mathbb{D}$  and  $\mathbb{E}$  are VDCs for which  $\mathbb{E}^{\mathbb{D}}$  exists, then it must consist of the following data:

- Objects are functors  $\text{Tight}(\mathbb{D}) \rightarrow \text{Tight}(\mathbb{E})$
- Tight arrows are natural transformations
- Loose arrows maps of spans

- n-Multi-cells assign to each n-multicell in  $\mathbb{D}$  an n-multicell in  $\mathbb{E}$  with the following boundary:

$$\begin{array}{ccccccc} F_0 x_0 & \xrightarrow{\Psi_1 H_1} & \cdots & \xrightarrow{\Psi_n H_n} & F_n x_n \\ \gamma_0(!, f) \downarrow & & & & \downarrow \gamma_1(!, g) \\ G_0 y_0 & \xrightarrow{\Psi J} & & & G_1 y_1 \end{array}$$

... (cont. on next slide)

# EXPONENTIALS

8

## ExPLICATION: EXPONENTIAL (cont.)

Where multicells are subject to functoriality with respect to vertical pasting:

$$\begin{array}{ccccccc}
 F_0 w_0 & \xrightarrow{\Psi_1 K_1} & F_1 w_1 & \xrightarrow{\Psi_2 K_2} & \cdots & \xrightarrow{\Psi_n K_n} & F_n w_n \\
 \downarrow F_0 h_0 & & \downarrow F_1 h_1 & & & & \downarrow F_n h_n \\
 F_0 x_0 & \xrightarrow{\Psi_1 H_1} & F_1 x_1 & \xrightarrow{\Psi_2 H_2} & \cdots & \xrightarrow{\Psi_n H_n} & F_n x_n \\
 \downarrow \gamma_0(!, f) & & \downarrow \gamma(\alpha) & & & & \downarrow \gamma_1(!, g) \\
 G_0 y_0 & \xrightarrow[\Phi J]{} & & & & & G_1 y_1 \\
 \downarrow G_0 k & & \downarrow \Phi \delta & & & & \downarrow G_1 k' \\
 G_0 z_0 & \xrightarrow[\Phi I]{} & & & & & G_1 z_1
 \end{array}
 = \quad
 \begin{array}{ccccccc}
 F_0 w_0 & \xrightarrow{\Psi_1 K_1} & F_1 w_1 & \xrightarrow{\Psi_2 K_2} & \cdots & \xrightarrow{\Psi_n K_n} & F_n w_n \\
 \downarrow \gamma_0(!, k f h_0) & & & & & & \downarrow \gamma_1(!, k' g h_n) \\
 G_0 z_0 & \xrightarrow[\Phi I]{} & & & & & G_1 z_1
 \end{array}$$

# PRO-REPRESENTABLE VDCS

## Theorem: Characterization of Pro-representable VDCs

Let  $\mathbb{D}$  be a VDC, and write  $\mathbb{D}(\varphi_1, \dots, \varphi_n; \psi) =: \mathbb{D}(\underline{\varphi}; \psi)$  for the set of cells with loose source the sequence  $\varphi_1, \dots, \varphi_n$  and with loose target  $\psi$ . Vertical pasting can be encoded by functions

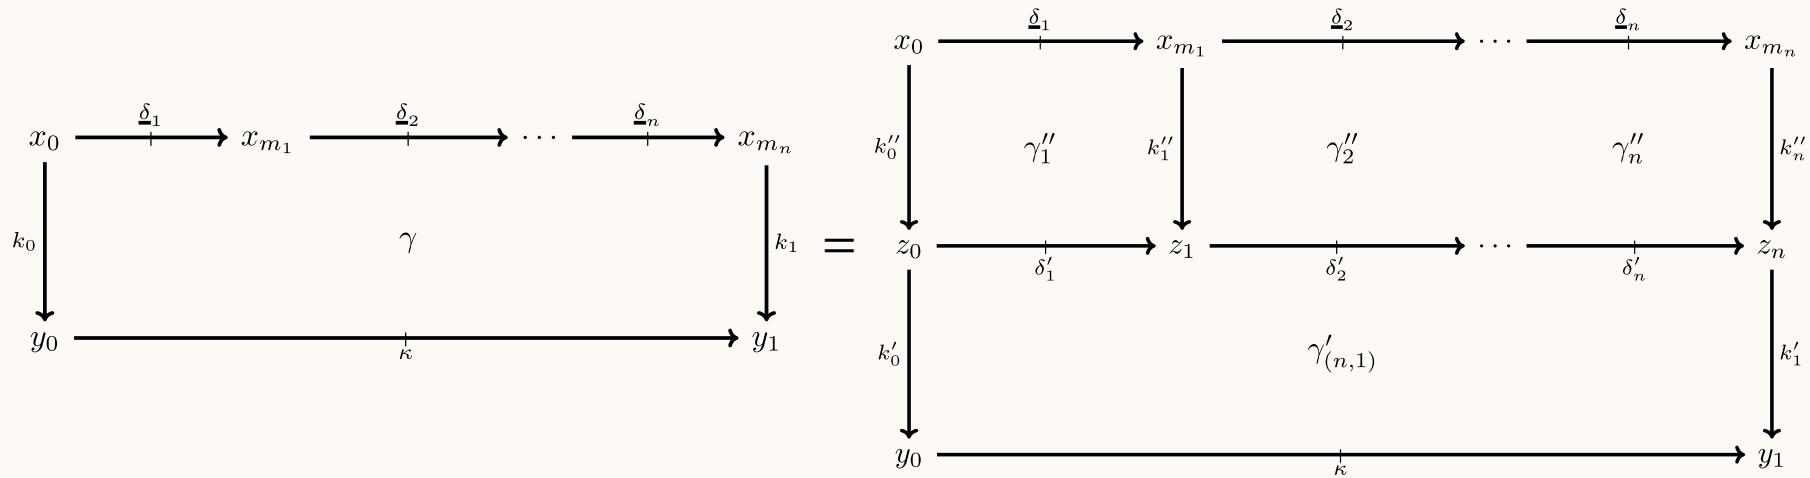

$$\int^{\varphi_i: \mathbb{D}} \mathbb{D}(\underline{\varphi}; \psi) \times (\mathbb{D}(\underline{\rho}_1; \varphi_1) \times_{\text{Tight}(\mathbb{D})_1} \cdots \times_{\text{Tight}(\mathbb{D})_1} \mathbb{D}(\underline{\rho}_n; \varphi_n)) \xrightarrow{\circ k_1, \dots, k_n} \mathbb{D}(\underline{\rho}; \psi)$$

out of co-ends, where  $|\underline{\rho}_i| = k_i$ . Then  $\mathbb{D}$  is a pro-representable VDC if and only if all such functions are isomorphisms.

# PRO-REPRESENTABLE VDCS

## Explication: Characterization of Pro-representable VDCs

In terms of pasting diagrams, a VDC  $\mathbb{D}$  is pro-representable precisely when for any  $N \geq 0$  and any partition  $N = k_1 + \dots + k_n$ ,  $N$ -multicells decompose as vertical pastings:

and any two decompositions are equivalent up to associativity of pasting with cells in the center of the decomposition

# REPRESENTABLE VDCS

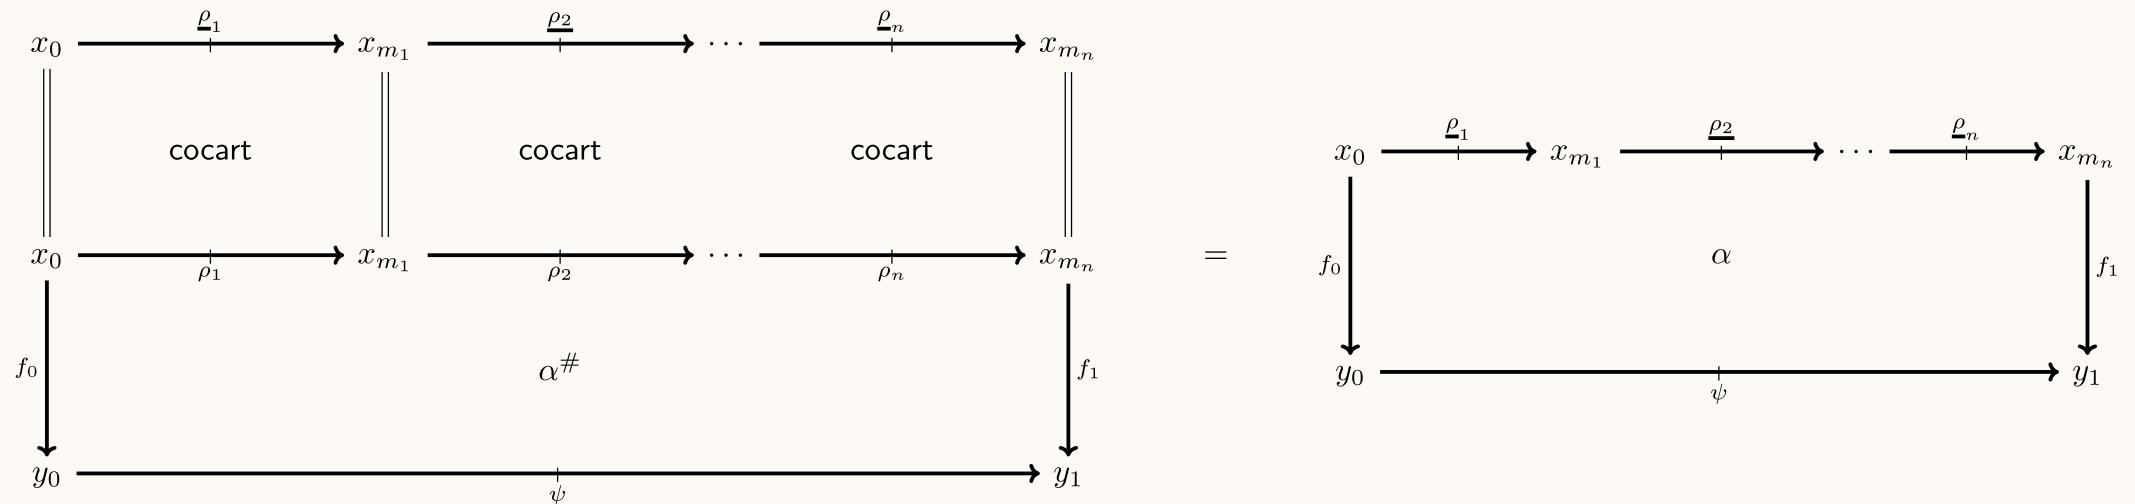

11

## Corollary: Representable $\Rightarrow$ Pro-representable

Representable VDCs (i.e. pseudo-double categories) are pro-representable.

### Proof Idea:

Let  $\mathbb{D}$  be a representable VDC. Then any cell admits a canonical decomposition

# REPRESENTABLE VDCS

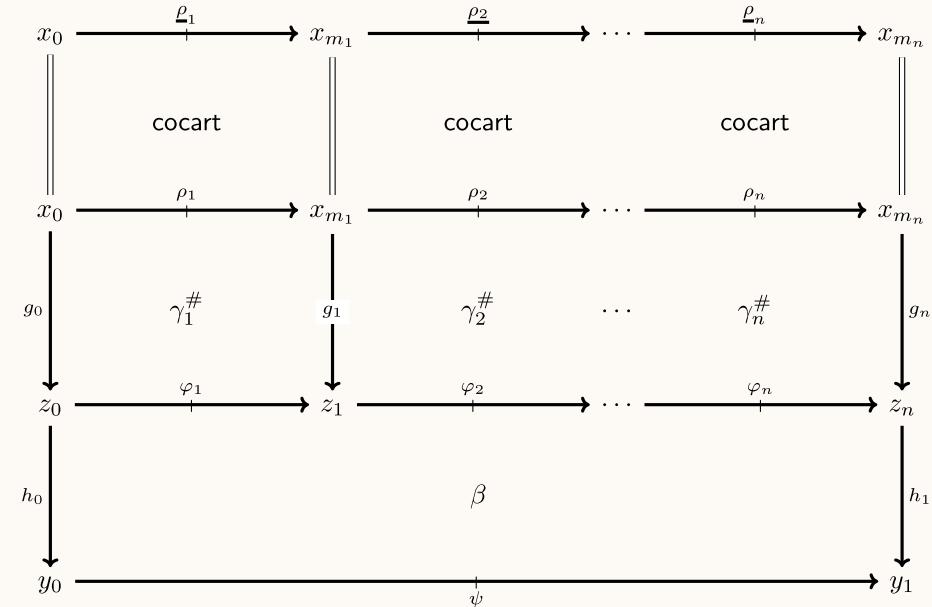

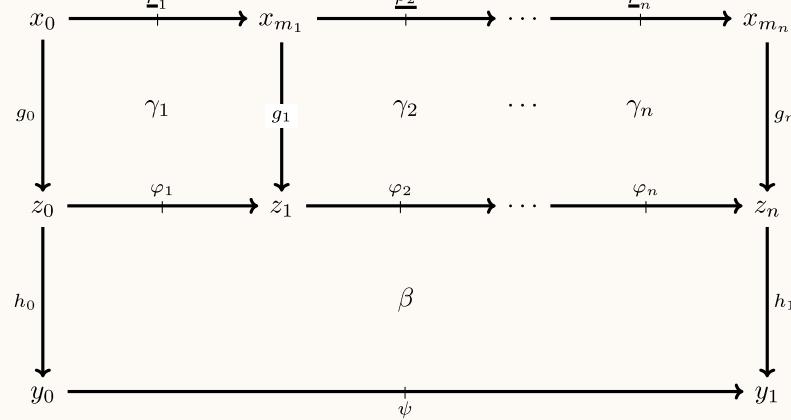

12

## Corollary: Representable $\Rightarrow$ Pro-representable

Representable VDCs (i.e. pseudo-double categories) are pro-representable.

### Proof Idea: (cont.)

Any other decomposition below left can be canonically factored through the composition cells:

# COSPANS ARE PRO-REPRESENTABLE

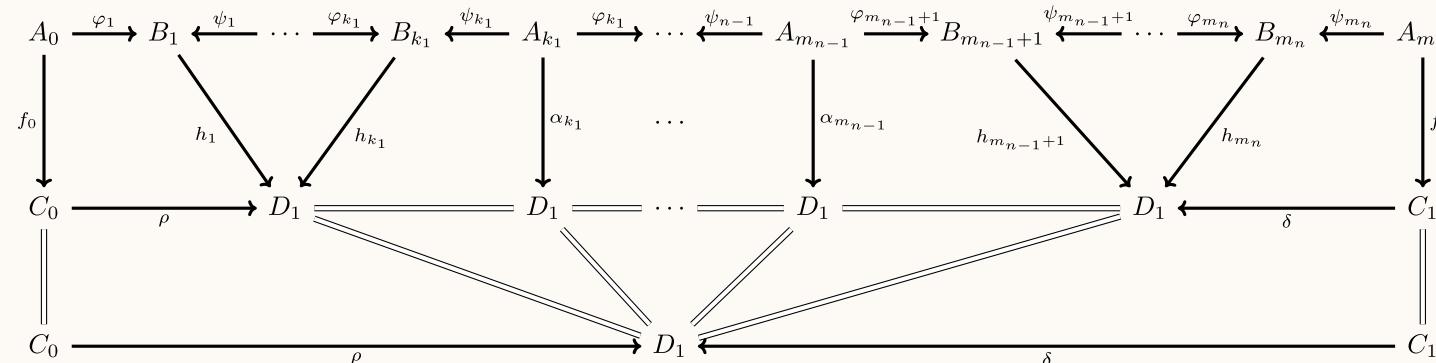

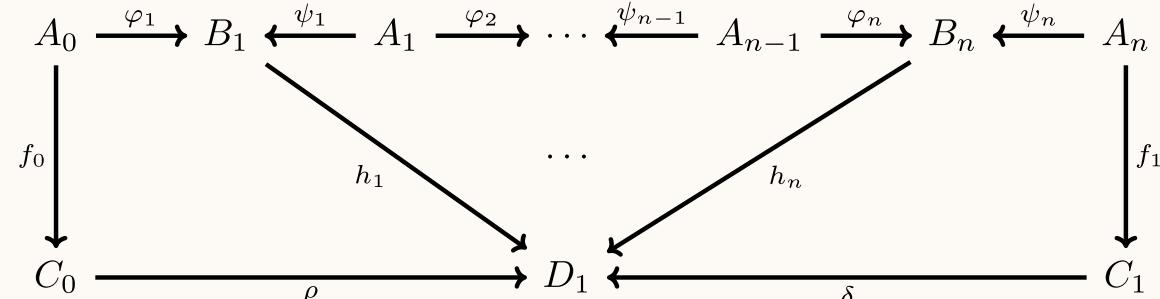

13

## Proposition: Cospan VDCs are Pro-representable

For any category  $\mathcal{E}$  the VDC  $\text{Cospan}(\mathcal{E})$  is pro-representable, and it is representable if and only if  $\mathcal{E}$  has finite pushouts.

**Proof Idea:** An arbitrary multicell:

admits a canonical decomposition:

for any partition of  $n$  (the case where  $k_1, k_n \geq 1$  is shown for simplicity).

# COSPANS ARE PRO-REPRESENTABLE

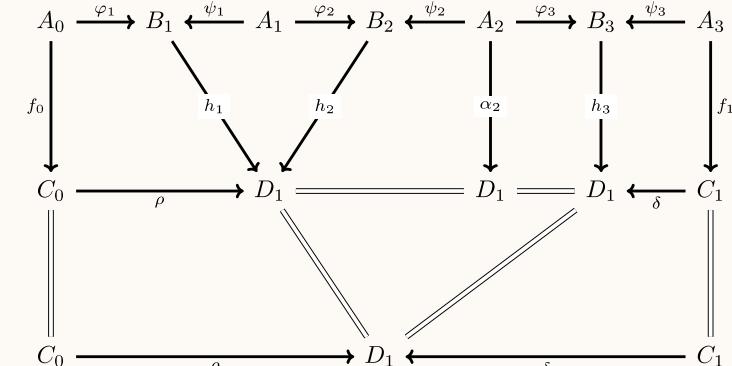

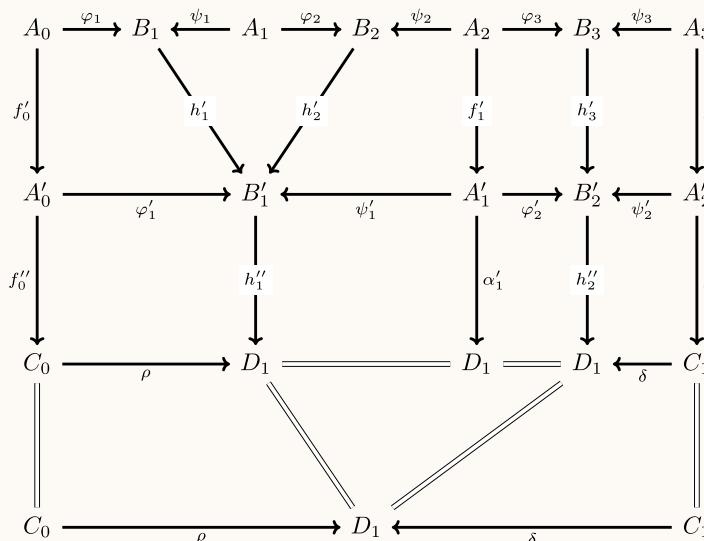

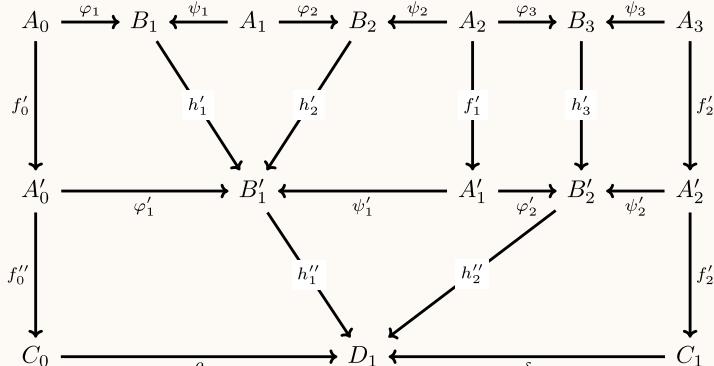

14

## Proposition: Cospan VDCs are Pro-representable

For any category  $\mathcal{E}$  the VDC  $\text{Cospan}(\mathcal{E})$  is pro-representable, and it is representable if and only if  $\mathcal{E}$  has finite pushouts.

# Proof Idea:

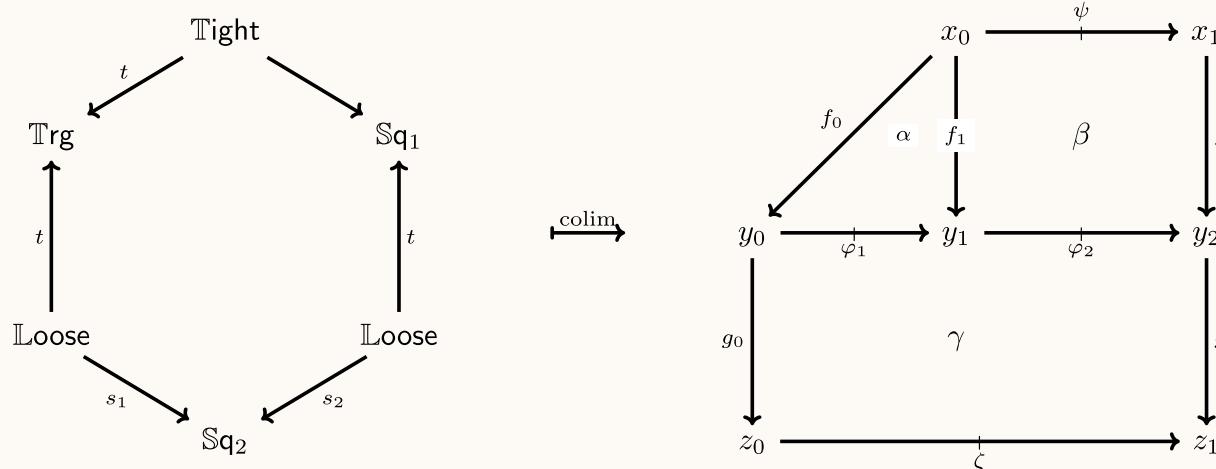

For uniqueness consider the case where  $n = 3, k_1 = 2, k_2 = 1$  as an example. Then an arbitrary decomposition, below left, can be seen to be equivalent to the canonical decomposition via sliding cells:

# NON-PRO-REPRESENTABLE VDC

## Non-example: Non-unital Walking Loose Arrow

The VDC  $\mathbb{L}\text{oose}$  consisting of two objects 0 and 1 and a single loose arrow  $0 \nrightarrow 1$  is not pro-representable. Consider the diagram and colimit  $\mathbb{C}$  in VDC depicted below:

Then  $\mathbb{C} \times \mathbb{L}\text{oose}$  has two non-identity cells, while the VDC obtained by applying  $- \times \mathbb{L}\text{oose}$  to the diagram before taking the colimit only has one.

# APPENDIX

16

## Modules in exponential VDCs:

### MODULES IN EXPONENTIAL VDC

17

#### Explication: Modules in Exponential

If  $\mathbb{D}$  and  $\mathbb{E}$  are VDCs for which  $\mathbb{E}^{\mathbb{D}}$  exists, then the VDC  $\text{Mod}(\mathbb{E}^{\mathbb{D}})$  consists of the following data:

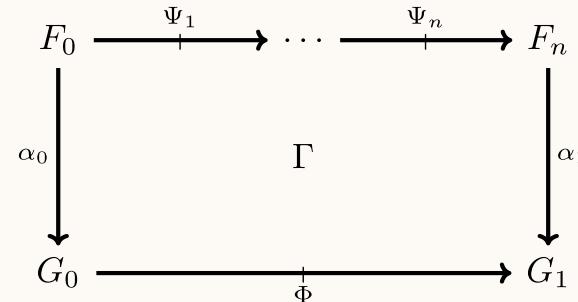

- An object is a VD functor  $F: \mathbb{D} \rightarrow \mathbb{E}$
- A tight arrow is a tight transformation between VD functors
- A loose arrow is a VD functor  $F: \text{Loose}_{\mathbb{U}} \times \mathbb{D} \rightarrow \mathbb{E}$ , where  $\text{Loose}_{\mathbb{U}}$  is the unital walking loose arrow
- An  $n$ -multicell is a diagram with boundary as below, satisfying certain equivariance identities

$$\begin{array}{ccccc} F_0 & \xrightarrow{\quad \varphi_1 \quad} & \cdots & \xrightarrow{\quad \varphi_n \quad} & F_n \\ \alpha_0 \downarrow & & \Gamma & & \downarrow \alpha_1 \\ G_0 & \xrightarrow{\quad \Phi \quad} & G_1 & & \end{array}$$

## Explication: Modules in Exponential

If  $\mathbb{D}$  and  $\mathbb{E}$  are VDCs for which  $\mathbb{E}^{\mathbb{D}}$  exists, then the VDC  $\text{Mod}(\mathbb{E}^{\mathbb{D}})$  consists of the following data:

- An object is a VD functor  $F: \mathbb{D} \rightarrow \mathbb{E}$
- A tight arrow is a tight transformation between VD functors
- A loose arrow is a VD functor  $F: \text{Loose}_u \times \mathbb{D} \rightarrow \mathbb{E}$ , where  $\text{Loose}_u$  is the unital walking loose arrow
- An n-multicell is a diagram with boundary as below, satisfying certain equivariance identities

## Explication: Modules in Exponential (Inner Equivariance)

Inner equivariance requires that the pasting diagrams below are equal for any  $1 < i < n$ :

$$\begin{array}{c}
 \begin{array}{ccccccccc}
 F_0 & \xrightarrow{\Psi_{[1,i-1]}} & F_{i-1} & \xrightarrow{\Psi_i} & F_i & \xrightarrow{F_i} & F_i & \xrightarrow{\Psi_{i+1}} & F_{i+1} & \xrightarrow{\Psi_{[i+2,n]}} & F_n \\
 \parallel & & \parallel & & & & \parallel & & \parallel & & \parallel \\
 F_0 & \xrightarrow{\Psi_{[1,i-1]}} & F_{i-1} & \xrightarrow{\Psi_i} & F_i & \xrightarrow{\Psi_{i+1}} & F_{i+1} & \xrightarrow{\Psi_{[i+2,n]}} & F_n \\
 \downarrow \alpha_0 & & & & & & & & \downarrow \alpha_1 & & \\
 G_0 & \xrightarrow{\Phi} & & & & & & & & & G_1
 \end{array} \\
 \Gamma
 \end{array}$$
  

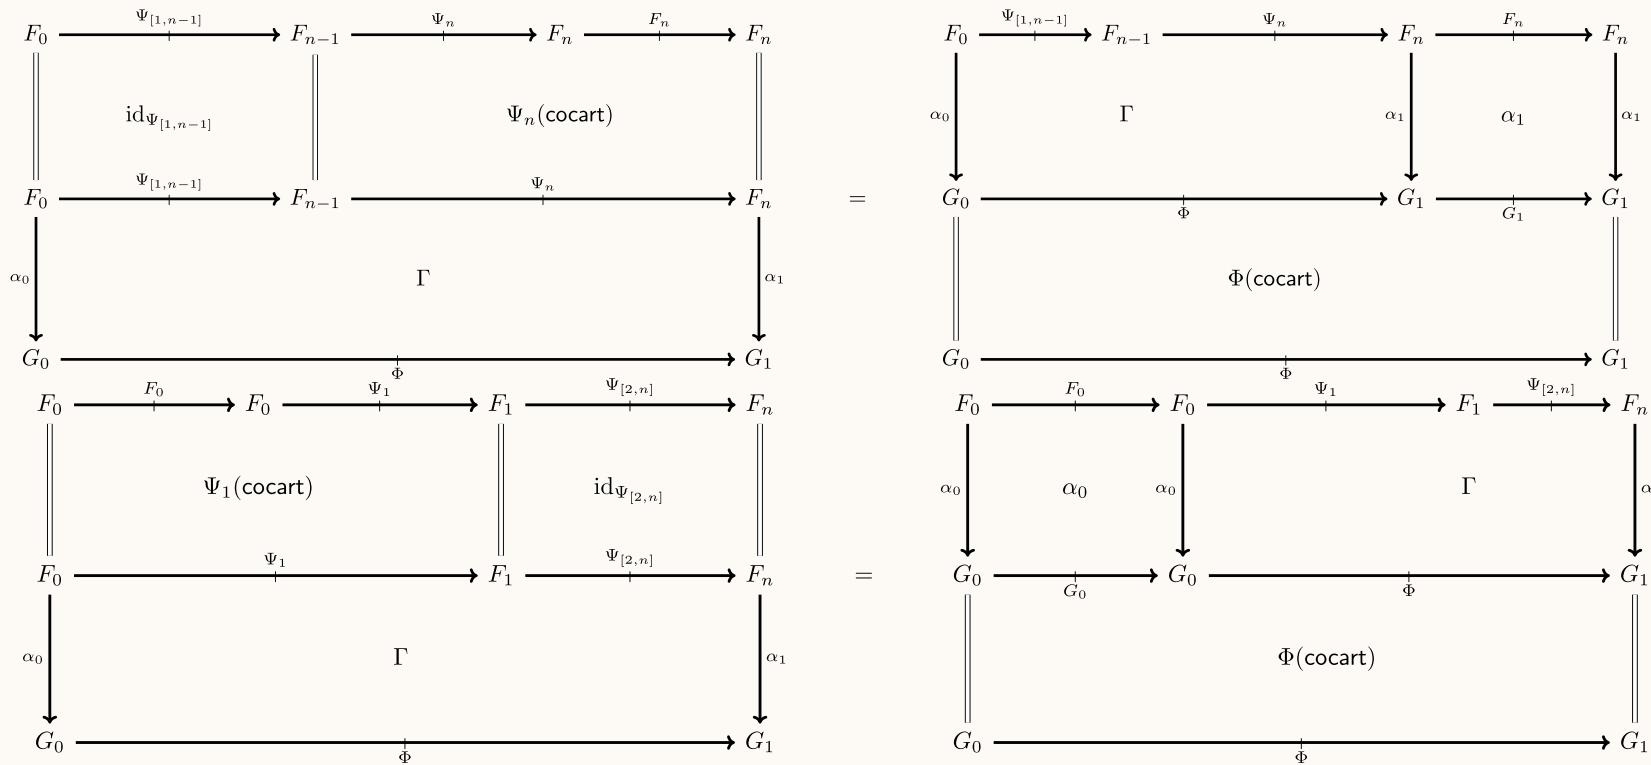

$$\begin{array}{c}
 = \quad \begin{array}{ccccccccc}
 F_0 & \xrightarrow{\Psi_{[1,i-1]}} & F_{i-1} & \xrightarrow{\Psi_i} & F_i & \xrightarrow{F_i} & F_i & \xrightarrow{\Psi_{i+1}} & F_{i+1} & \xrightarrow{\Psi_{[i+2,n]}} & F_n \\
 \parallel & & \parallel & & & & \parallel & & \parallel & & \parallel \\
 F_0 & \xrightarrow{\Psi_{[1,i-1]}} & F_{i-1} & \xrightarrow{\Psi_i} & F_i & \xrightarrow{\Psi_{i+1}} & F_{i+1} & \xrightarrow{\Psi_{[i+2,n]}} & F_n \\
 \downarrow \alpha_0 & & & & & & & & \downarrow \alpha_1 & & \\
 G_0 & \xrightarrow{\Phi} & & & & & & & & & G_1
 \end{array} \\
 \Gamma
 \end{array}$$

# **MODULES IN EXPONENTIAL VDC**

19

# Explication: Modules in Exponential (Outer Equivariance)

Outer equivariance requires we have the two pasting equalities below:

## KEY TAKEAWAYS

- VDCs provide the necessary flexibility to characterize universal properties of double categorical constructions
- Exponentiable VDCs are those admitting essentially unique cell decompositions

## FUTURE DIRECTIONS

- Characterize exponentiable maps between VDCs
- Determine what (co)limits and construction pro-representable VDCs are closed under
- Explore properties of enrichment using loose bimodules
